

CUSTOMIZED FABRICATION

WILSON·HURD®

At Wilson-Hurd®, we focus on “custom” fabrication – from chassis enclosures to fastener insertion to sophisticated die-cutting to laminating to distinct custom forming. Our engineers will review your requirements and create a solution for your particular application. And best of all, we do this cost effectively.

Our three manufacturing facilities provide more than 115,000 square feet of capacity to ensure the most efficient processing of your order. State-of-the-art techniques include laser machining, automated strip feed and laminating applications, optical registration, as well as computer-aided piercing and blanking. To streamline our production processes, we use specially

designed cells that allow for an entire job to be completed from start to finish within selected areas of our manufacturing plants.

At Wilson-Hurd, the creativity does not stop at the final step in the fabrication process. Following fabrication, our packaging team will review your part and develop specialized packaging to ensure that your custom fabricated product is protected while in transit to its final destination.

For those challenging product design applications, remember Wilson-Hurd and our custom fabrication capabilities.
